## gb_gss2:*

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

best homologue in strain IL1403 is htrA (95%)
Class: shotgum
High quality sequence start: 30
High quality sequence stop: 1408.
Location/Qualifiers
1. 1438

/note="Websize acid-treated seedlings"
/note="Websize acid-treated seedlings grown
in hydroponic culture. After 12 days, medium was
supplemented with a solution of 1 mM ABA. Roots and leaves
were misted with a solution of 1 mM ABA. Roots and leaves
were misted after 3 % /, 12, and 24 hr and material from
all time points was combined prior to RNA isolation.
Double-stranded cDNA was cloned unidirectionally into
different Draili sites of the pMR188-FI3 vector (5-prime
Draili site is CACTGTGTG, 3-prime Draili site is
CACCATGTG). XhoI excises the cDNA insert."

Library constructed by Dr. Yutaka Suzuki and Dr. Sumio Sugano in
the Human Genome Center, University of Tokyo Institute of Medical
Science; plant material and RNA prepared at Texas A. & M University,
sequencing done in the Laboratory for Genomics and Bioinformatics,
University of Georgia. Sequence ends have been trimmed to exclude
vector and regions below Phred quality 16. Three-prime sequences
are presented as their reverse complement and have been trimmed to
exclude polyA.

CA148171
SCEZRZ1017F10.g RZ1 Saccharum officinarum cDNA clone SCEZRZ1017F10
S.', mRNA sequence.
CA148171.1 GI:35048941
EST.
DNA Sequencing by: Agencourt Bioscience Corporation

Clone distribution: MGC clone distribution information can be
found through the I.M.A.G.B. Consortium/LiNL at:

The library was characterised by oligonucleotide fingerprinting
The library was characterised by oligonucleotide fingerprinting
(ONFP) to reduce sequencing redundancy. According to the ONFP
procedure, clones giving the same hybridisation pattern with a
battery of 200 Bmer oligonucleotides are grouped into clusters. One
clone per cluster is selected for sequencing. The size of each
analysed library. The cluster size as well the coordinates of the
rest of the clones assigned to the same fingerprint cluster as the
clone from which the above BST is generated is available at the
amphioxus project site at: http://www.molgen.mpg.de/amphioxus/
Clones and filters are distributed via the Resource Center/Primary
Database of the German Genome Project (http://www.rzpd.de)

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                   US-09-684-215B-4

The invention relates to a recombinant nucleic acid molecule encoding a fusion polypeptide, comprising a polynucleotide sequence of Ral2, a 14 Kba C-terminal fragament of serine protease antiquen WTB13A of for the recombinant fusion nucleic acids and polypeptides are useful for providing stable and high yield expression of fusion polypeptides of both cukaryotic and prokaryotic origin and to encode a protein product for use as an antigen for detecting seriam antibodies. The presence of serum antibodies to M. tuberculosis antigens in an individual indicates that the fusion polypeptides are useful as cources of proteins for monitoring binding of serum antibodies to fusion proteins and as an immunogen to induce and/or enhance immune responses. The coding sequences can be ligated with a coding sequence of another molecule such as M. tuberculosis antigens, a cytokine or an adjuvant and can be used in vivo as a DNA vaccine. This polynucleotide sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     GTCCAACGCGTGGGTCGGGAGCGCTCCGGCGCAAGTCTCGGCATCTCCACCGGCGACGTG 240

Skeiky Y,

```
The invention relates to a recombinant nucleic acid molecule encoding a fusion polypeptide, comprising a polynucleotide sequence of Ral2, a 14 can polypeptide, comprising a polynucleotide sequence of Ral2, a 14 molecular fragment of Series proteide sequence of Ral2, a 14 molecular function and a neterologous polynucleotide sequence. The recombinant fusion nucleic acids and polypeptides are useful for providing steadhe and high yield expression of fusion polypeptides of both eukaryotic and prokaryotic origin and to encode a protein product for use as an antigen for detecting serum antibodies. The presence of serum antibodies to M. tuberculosis antigens in an individual indicates that the individual is infected with it. The fusion polypeptides are useful as sources of proteins for monitoring binding of serum antibodies to fusion proteins and as an immunogen to induce and/or enhance immune responses. The coding sequences can be ligated with a coding sequence of another molecule such as M. tuberculosis antigens, a cytokine or an adjuvant and can be used in vivo as a DNA vaccine. This polynucleotide sequence represents the DNA encoding the Ral-mammaglobin fusion protein. (Updated on 06-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     50

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This DNA sequence includes a coding region for a recombinant Mycobacterium tuberculosis bi-antigen fusion protein (see AAY32071), termed MxD24, composed of the antigens Ra12 and DPPD. The DNA is useful for the recombinant production of the fusion protein. Coding sequences for the antigens were modified by PCR in order to facilitate their fusion and subsequent expression of the fusion protein, and then ligated. The invention provides fusion protein, and then ligated. The invention provides fusion proteins (see AAY32059-71) containing at least 2 M. tuberculosis antigens. The new fusion proteins and polymucleotides encoding them are useful as vaccines for preventing tuberculosis (claimed), for diagnosis (via in vitro assays or intradermal skin tests for detection of anti-M. tuberculosis antibodies), monitoring of disease progression, and treatment of tuberculosis. They are more effective
                                                                                                                                                                                                                                                                                                                           IleThrAlaValAspGlyAlaProlleAsnSerAlaThrAlaMetAlaAspAlaLeuAsn 100

The invention relates to a recombinant nucleic acid molecule encoding a fusion polypeptide, comprising a polymucleotide sequence of Ral2, a 14 bac-terminal fragment of serine protease antigen MTB32A of MD C-terminal fragment of serine protease antigen MTB32A of MD C-terminal fragment of serine protease antigen MTB32A of production the confidence of the sequence. The recombinant fusion nucleic acids and polypeptides are useful for providing stable and high yield expression of fusion polypeptides of both cutaryotic and prokaryotic origin and to encode a protein product for use as an antigen for detecting serum antibodies. The presence of serum antibodies to M. tuberculosis and an indicates that the individual is infected with it. The fusion polypeptides are useful as sources of proteins for monitoring binding of serum antibodies to fusion proteins and as an immunogen to induce and/or enhance immune responses. The coding sequences can be ligated with a coding sequence of another molecule such as M. tuberculosis antigens, a cytokine or an adjuvant and can be used in vivo as a DNA vaccine. This polymucleotide sequence conception to indicate the DNA encoding the Ral2-DPPD fusion protein
                                                                                                                                                        Recombinant nucleic acid molecule for producing high yield expression of desired fusion polypeptides, encodes fusion polypeptide comprising Mycobacterium tuberculosis coding sequence and heterologous polypeptide.
                                                                                                                                                                                                                                                                             Example 1; Fig 3; 39pp; English.
                                                                             WPI; 2001-266299/27.

The invention relates to a recombinant nucleic acid molecule encoding a fusion polypeptide. The recombinant nucleic acid comprises a heterologous polynucleocide sequence encoding an antigen or an antigent fragment from Mycobacterium sp. and a Leishmania polynucleotide sequence encoding a polypeptide or its fragment. The Leishmania polynucleotide is selected from TSA, LeIF, MIS, and 6H polynucleotides. Sequences of the invention are useful as vaccines to eliciting immune response in mammals. They are useful as vaccines to elicit protective immunity against pathogenic microorganisms such as Leishmania and Mycobacterium tuberculesis. Fusion polypeptides are used for enhancing the expression of polynucleotides, as in vivo diagnostic agents and for ralsing antibodies in a non-human animal. The invention is used in gene therapy. The present sequence is M. tuberculosis RajsFLMutSA mutant antigenic protein encoding DNA 100 717 777 837 897 New recombinant nucleic acid molecule comprising a Leishmania TSA, LeIF, M15 or 6H polynuclectide, useful as vaccine to elicit protective immunity against pathogenic microorganisms e.g. Leishmania and Mycobacterium tuberculosis. 40 9 80 GTCCAACGCGTGGTCGGGAGCGCTCCGGCGAAGTCTCGGCATCTCCACCGGCGACGTG IleGlyProThrAlaPheLeuGlyLeuGlyValValAspAsnAsnGlyAsnGlyAlaArg 81 IleThrAlaValAspGlyAlaProlleAsnSerAlaThrAlaMetAlaAspAlaLeuAsn GlyGlnalaMetalallealaGlyGlnIleArgSerGlyGlyGerProThrValHis ValGlnArgValValGlySerAlaProAlaAlaSerLeuGlyIleSerThrGlyAspVal Sequence 1002 BP; 169 A; 331 C; 341 G; 161 T; 0 U; 0 Other; 1002 132 0 0 Length:

                                                                                                                                                                                                                                                                                                                                                                                                                    8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a recombinant nucleic acid molecule encoding a fusion polypeptide. The recombinant nucleic acid comprises a heterologous polynuclectide sequence encoding an antigen or an antigenic fragment from Mycobacterium sp. and a Leishmania polynucleotide sequence encoding a polympeptide or its fragment. The Leishmania polynucleotide is selected from TSA, LeIF, MIS, and 6H polynucleotides. Sequences of the invention are used in methods for eliciting immune response in mammals. They are useful as vaccines to elicit protective immunity against pathogenic microorganisms such as Leishmania and Mycobacterium tuberculosis. Fusion polypeptides are used for enhanding the expression of polynucleotides, as in vivo diagnostic agents and for raising antibodies in a non-human animal. The invention is used in gene therapy. The present sequence is M. tuberculosis mature Rais (N-terminus of MTB32A; RA35FL) antigen encoding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New recombinant nucleic acid molecule comprising a Leishmania TSA, LeIF, MIS or 6H polynucleotide, useful as vaccine to elicit protective immunity against pathogenic microorganisms e.g. Leishmania and Mycobacterium tuberculosis.

WPI; 2002-147798/19. P-PSDB; AAE17567 Composition comprising MTB39 antigen and MTB32A antigen from Mycobacterium species, useful for eliciting immune response in a subject.

Claim 67; Page 96-97; 136pp; English.

Mycobacterium species antigens, nucleotides encoding them and compositions comprising such fusion protesins. The present invention particularly relates to nucleic acids encoding them and particularly relates to nucleic acids encoding fusion protesins that include two or more individual M. tuberculosis antigens which increase the serological sensitivity of sera from individuals infected with tuberculosis and methods for their use in diagnosis, prevention and treatment of tuberculosis infection. Sequences of the invention are useful for eliciting an immune response in a mammal, e.g., human, custoful for eliciting an immune response in a mammal, e.g., human, consevention of Mycobacterium infection. The fusion proteins and the prevention of Mycobacterium in ediagnosis, treatment and prevention of Mycobacterium in vitro and in vivo assays for detecting humoral antibodies or cell-mediated immunity against M. tuberculosis, for the immunogens to generate or elicit a protective immune response in a patient and for raising anti-M. tuberculosis antibodies in a non-human continuation are also used as vaccines. WTB32A fusion proteins of the invention are also used as vaccines. WTB32A fusion proteins of the invention are useful as in vivo diagnostic agents Mycobacterium species Ra32FL mature protein mutant, Ra32FLMutSA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequences AAX34001-X34252 represent nucleic acids encoding secreted proteins from various Mycobacterium species microorganisms. The nucleotide sequences can be used as primers and probes for methods for detecting and identifying mycobacteria, especially belonging to the M. tuberculosis complex. The encoded proteins can be used in vaccines for

The nucleotide sequences can be used as primers and probes for methods for detecting and identifying mycobacteria, especially belonging to the M. tuberculosis complex. The encoded proteins can be used in vaccines for immunisation against a bacterial or viral infection.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   204
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The sequence encodes Mycobacterium tuberculosis fusion protein, TDRA12-HTCC#1 and includes a His tag at the N-terminus to aid purification. Compositions comprising at least 2 heterologous antigens, as a fusion protein, and vectors expressing the fusion proteins are used as vaccines to prophylactically immunise mammals (especially humans) against infection by Mycobacteria. The compositions contain at least 2 heterologous antigens that increase the serological sensitivity of individuals infected with tuberculosis, a disease frequently affecting patients with acquired immunodeficiency disease, AIDS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         9

                                                                                       ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a recombinant nucleic acid molecule encoding a fusion polypeptide, comprising a polynucleotide sequence of Ral2, a 14 Kps of C-terminal fragment of serine protease antigen MTB32A of 14 Mycobacterium tuberculosis, and a heterologous polynucleotide sequence. The recombinant fusion nucleic acids and polypeptides are useful for providing stable and high yield expression of fusion polypeptides of both cukaryotic and prokaryotic origin and to encode a protein product for use as an antigen for detecting serum antibodies. The presence of serum antibodies to M. tuberculosis antigens in an individual indicates that the individual is infected with it. The fusion polypeptides are useful as sources of proteins for monitoring binding of serum antibodies to fusion proteins and as an immunogen to induce and/or enhance immune responses. The coding sequences can be ligated with a coding sequence of another molecule such as M. tuberculosis antigens, a cytokine or an adjuvant and can be used in vivo as a DNA vaccine. This polynucleotide sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Recombinant nucleic acid molecule for producing high yield expression of desired fusion polypeptides, encodes fusion polypeptide comprising Mycobacterium tuberculosis coding sequence and heterologous polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Ral2; serine protease antigen; MTB32A; Mycobacterium tuberculosis; vaccine; eukaryotic; prokaryotic origin; serum antibody; fusion protein; immunogen; cytokine; gene; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 1742 BP; 372 A; 569 C; 490 G; 311 T; 0 U; 0 Other;

tusion polypeptide, comprising a polynucleotide sequence of Ral2, a 14

KDa C-terminal fragment of serine protease antigen MTB32A of

Mycobacteriuu tuberculosis, and a heterologous polynucleotide sequence.

The recombinant fusion nucleic acids and polypeptides are useful for

providing stable and high yield expression of fusion polypeptides of both

eukaryotic and prokaryotic origin and to encode a protein product for use
as an antigen for detecting serum antibodies. The presence of serum

antibodies to M. tuberculosis antigens in an individual indicates that

the individual is infected with it. The fusion polypeptides are useful as

sources of proteins for monitoring binding of serum antibodies to fusion

proteins and as an immunogen to induce and/or enhance immune responses.

The coding sequences can be ligated with a coding sequence of another

molecule such as M. tuberculosis antigens, a cytokine or an adjuvant and

can be used in vivo as a DNA vaccine. This polymucleotide sequence

represents the DNA encoding the Mycobacterium tuberculosis MTB32A protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     1058 GGGCATCATCCCGGTGACGTCATCTCGGTGACCTGGCAAACCAAGTCGGGCGCGCACCGT 1117

The invention relates to a novel nucleic acid encoding a fusion polypeptide, comprising a MTB32A and MTB39 antigen, or MTB32A, MTB32A and MTB39 antigen, or MTB32A, MTB39 and MTB38 antigen from a Mycobacterium species of the tuberculosis complex. A polypeptide of the invention has tuberculostatic activity. A polypeptide of the invention may have a use in gene therapy, and as a polymucelotide of the invention may have a use in gene therapy, and as a vectine. The methods and compositions of the present invention are useful for diagnosing, preventing and/or treating tuberculosis infection. The present sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New isolated nucleic acid encoding a fusion polypeptide with the MTB32A and MTB39 antigens, with or without the MTB85A antigen, from a Mycobacterium species, useful for diagnosing, preventing and/or treating tuberculosis infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      81 IleThrAlaValAspGlyAlaProlleAsnSerAlaThrAlaMetAlaAspAlaLeuAsn
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ATCACCGCGGTCGACGGCGCTCCGATCAACTCGGCCACCGCGGATGGCGGGCTTAAC
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 61 ValGlnArgValValGlySerAlaProAlaAlaSerLeuGlyIleSerThrGlyAspVal

The recombinant nucleic acid comprises a heterologous bolymucleotide sequence encoding an antigen or an antigenic fragment from my mucleotide sequence encoding a mantigen or an antigenic fragment from Mycobacterium sp. and a Leishmania polymucleotide sequence encoding a polypeptide or its fragment. The Leishmania polymucleotide is selected from TGA, Leff, MIS, and 6H polymucleotides of the invention are used in methods for eliciting immune response in manmals. They are useful as vaccines to eliciting immune response in manmals. They are useful as vaccines to elicit protective immunity against pathogenic microorganisms such as Leishmania and Mycobacterium tuberculosis. Fusion in vivo diagnostic agents and for raising antibodies in a non-human animal. The invention is used in gene therapy. The present sequence is a nimal minal minal fusion protein. This fusion protein comprises and tot assambles mutant protein and Ralz protein from Mycobacterium sp. (Updated on 29-AUG-2003 to standardise OS protein from Mycobacterium sp. (Updated on 29-AUG-2003 to standardise OS

Composition comprising MTB39 antigen and MTB32A antigen from Mycobacterium species, useful for eliciting immune response in a subject.

Claim 81; Page 108-109; 136pp; English.

The present invention relates to fusion proteins containing at least two Mycobacterium species antigens, nucleotides encoding them and compositions comprising such fusion proteins. The present invention particularly relates to nucleic acids encoding fusion proteins that include two or more individual M. tuberculosis antigens which increase the serological sensitivity of sera from individuals infected with increase the serological sensitivity of sera from individuals infected with tuberculosis and methods for their use in diagnosis, prevention and treatment of tuberculosis infection. Sequences of the invention are useful for elliciting an immune response in a mammal, e.g., human, cuseful for elliciting an immune response in a mammal, e.g., human, in vitro and in vivo assays for detecting humoral artibodies or cell-mediated immunity against M. tuberculosis, for the immunogens to generate or elicit a protective immune response in a patient and for raising anti-M. tuberculosis antibodies in a non-human and for raising anti-M. tuberculosis antibodies in a non-human and for raising anti-M. tuberculosis antibodies in a non-human are also used as vaccines MRB12A fusion proteins of the invention are useful as in vivo diagnostic agents for intradermal skin test. The present sequence is a DNA encoding more accounts of the invention are useful as in vivo diagnostic agents.

CORI-) CORIXA CORP.

Skeiky Y, Guderian J;

WPI; 2001-266299/27. P-PSDB; AAO22142. Recombinant nucleic acid molecule for producing high yield expression of desired fusion polypeptides, encodes fusion polypeptide comprising Mycobacterium tuberculosis coding sequence and heterologous polypeptide.

Disclosure; Fig 6; 39pp; English.

The invention relates to a recombinant nucleic acid molecule encoding a fusion polypeptide, comprising a polymucleotide sequence of Ral2, a 14 (Mycobacterium theoreulosis, and a heterologous polymucleotide sequence. The recombinant fusion nucleic acids and polypeptides are useful for providing stable and high yield expression of fusion polypeptides of both eukaryotic and prokaryotic origin and to encode a protein product for use as an antigen for detecting serum antibodies. The presence of serum antibodies to M. tuberculosis antigens in an individual is infected with it. The fusion polypeptides are useful as the individual is infected with it. The fusion polypeptides to fusion proteins and as an immunogen to induce and/or enhance immune responses. The coding sequences can be ligated with a coding sequence of another molecule such as M. tuberculosis antigens, a cytokine or an adjuvant and can be used in vivo as a DNA vaccine. This polymucleotide sequence in protein.

The invention relates to a purified polypeptide which induces an immune response of Mycobacterium tuberculosis. Polypeptides of the invention are useful for diagnosing, treating or preventing M. tuberculosis infection, particularly tuberculosis infection. In particular, the polypeptides are useful as a vaccine formulation with an adjuvant to afford long-term protection in animals against the development of tuberculosis. The protectin coding sequence may be used to encode a protein product for use as an immunogen to induce and/or enhance an immune response to M. tuberculosis tuberculosis. This sequence represents DNA encoding an M. tuberculosis (use fusion protein of the invention. (Updated on 29-AUG-2003 to standardise os field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           122

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    GICCAACGCGICGICGGGAGCGCICCGGCGCAAGICICGGCATCICCACCGGCGACGIC 302
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This DNA sequence includes a coding region for a recombinant Wycobacterium tuberculosis tri-antigen fusion protein (see AA132059), termed Mtb32A, composed of the antigens Ral2, TbH9 and Ra35. The DNA is useful for the recombinant production of the fusion protein. Coding sequences for the antigens were modified by PCR in order to facilitate their fusion and subsequent expression of the fusion protein. 3 Coding sequences for Ral2, TbH9 and Ra25 were ligated to encode Mtb32A. The invention provides fusion proteins (see AAY32059-71) containing at least 2 M. tuberculosis antigens. The new fusion proteins and polymucleotides encoding them are useful as vaccines for preventing tuberculosis claimed), for diagnosis (via in vitro assays or intradermal skin tests for detection of anti-M. tuberculosis antibodies), monitoring of disease progression, and treatment of tuberculosis. They are more effective immunogens than mixtures of the individual protein components
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         GlyGlnAlaMetAlaIleAlaGlyGlnIleArgSerGlyGlyGerProThrValHis 40

The invention relates to a recombinant nucleic acid molecule encoding a fusion polypeptide. The recombinant nucleic acid comprises a heterologous polymuclectide sequence encoding an antigen or an antigenic fragment from Mycobacterium sp. and a Leishmania polymucleotide sequence encoding a polypeptide or its fragment. The Leishmania polymucleotide is selected from TSA, Leif, MIS, and 6H polymucleotides. Sequences of the invention are used in methods for eliciting immune response in mammals. They are useful as vaccines to elicit protective immunity against pathogenic microorganisms such as Leishmania and Mycobacterium tuberculosis. Fusion propeptides are used for enhancing the expression of polymucleotides, as in vivo diagnostic agents and for raising antibodies in a non-human and man and for raising antibodies in a non-human and man and for raising antibodies in a non-human and man and for raising antibodies in a non-human and man Rais protein from Mycobacterium tuberculosis and TDHS protein from Mycobacterium tuberculosis and TDHS protein from Mycobacterium sp. (Updated on 29-MUG-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New recombinant nucleic acid molecule comprising a Leishmania TSA, LeIF, MIS or 6H polymuclectide, useful as vaccine to elicit protective immunity against pathogenic microorganisms e.g. Leishmania and Mycobacterium tuberculosis.

The present invention relates to fusion proteins containing at least two Mycobacterium species antigens, nucleotides encoding them and comprising such fusion proteins. The present invention particularly relates to nucleic acids encoding fusion proteins that include two or more individual M. tuberculosis antigens which increase the serological sensitivity of sera from individuals infected with the tuberculosis infection. Sequences of the invention and treatment of tuberculosis infection. Sequences of the invention and treatment of tuberculosis infection. Sequences of the invention are useful for eliciting an immune response in a mammal, e.g., human, immunised with BGG. They are useful in the diagnosis, treatment and prevention of Mycobacterium infection. The fusion proteins and the polymoulectices are useful as diagnosic tools in partients infected with Mycobacterium, in vitro and in vivo assays for detecting humoral antibodies or cell-mediated immunity against M. tuberculosis, for the immunogens to generate or elicit a protective immune response in a patient and for raising anti-M. tuberculosis antibodies in a non-human continual sequences of the invention are also used as vaccines MyrmalsA insion proteins of the invention are also used as vaccines. Myrcobacterium species MTB72R (Ral2-TDM9-Ra35) fusion protein
                                                                                                                                                                                                                                                                                  Composition comprising MTB39 antigen and MTB32A antigen from
Mycobacterium species, useful for eliciting immune response in a subject.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                Claim 62; Page 103-106; 136pp; English

From a Mycobacterium species of the tuberculosis complex. A polypeptide of the invention has tuberculostatic activity. A polymerolotide of the invention may have a use in gene therapy, and as a polymucelotide of the invention may have a terminal may not a second the present invention are useful for diagnosing, preventing and/or treating tuberculosis infection. The present sequence is used in the exemplification of the invention.

```
New isolated nucleic acid encoding a fusion polypeptide with the MTB32A and MTB39 antigens, with or without the MTB85A antigen, from a Mycobacterium species, useful for diagnosing, preventing and/or treating tuberculosis infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a novel nucleic acid encoding a fusion polypopetide, comprising a MTB32A and MTB39 antigen, or MTB32A, MTB39 and MTB85A antigen from a Mycobacterium species of the tuberculosis complex. A polypeptide of the invention has tuberculostatic activity. A

                                                                                                                                                                                                 The invention relates to a novel nucleic acid encoding a fusion polypeptide, comprising a MTB32A and MTB39 antigen, or MTB32A, MTB39 and MTB85A and mTB85A and mTB85A and mTB85A and mTB85A and mTB85A and more of the ruberculosis ocmplex. A polypeptide of the invention has tuberculostatic activity. A polymucelotide of the invention may have a use in gene therapy, and as a vecine. The methods and compositions of the present invention as useful for diagnosing, preventing and/or treating tuberculosis infection. The present sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   324

/*tag= a /product= "Mycobacterium sp. MTB72F-Leishmania sp. MAPS (aka r95£) fusion protein"

cocation/Qualifiers

The invention relates to a recombinant nucleic acid molecule encoding a fusion polypeptide. The recombinant nucleic acid comprises a heterologous polymucleotide sequence encoding an antigen or an antigenic fragment from Mycobacterium sp. and a Leishmania polymucleotide sequence encoding a polymucleotide sequence encoding a polypeptide or its fragment. The Leishmania polymucleotide is selected from TSA, LeIF, M15, and 6H polymucleotides. Sequences of the invention are useful as vaccines to eliciting immune response in mammals. They are useful as vaccines to elicit protective immunity against pathogenic microorganisms such as Leishmania and Mycobacterium tuberculosis. Fusion polypeptides are used for enhancing the expression of polymucleotides, as in vivo diagnostic agents and for raising antibodies in a non-human animal. The invention is used in gene therapy. The present sequence is Mycobacterium sp. MTB72F-Leishmania sequence comprises Mycobacterium sp. MTB72F (at 22 kDa poly-protein fusion construct comprising Ral2-TDH9-Ral35) linked to the Leishmania TSA (MAPS). (Updated on 29-AUG-2003 to Sequence 2808 BP; 466 A; 889 C; 982 G; 471 T; 0 U; 0 Other; Example 6; Page 128-129; 155pp; English standardise OS field)

The invention relates to a novel nucleic acid encoding a fusion polypeptide, comprising a MTB32A and MTB39 antigen, or MTB32A, MTB32A and MTB95 antigen, or MTB32A, MTB32B and wTB95A antigen from a Mycobacterium species of the tuberculosis complex. A polypeptide of the invention has tuberculostatic activity. A polymeclotide of the invention may have a use in gene therapy, and as a practine. The methods and compositions of the present invention are useful for diagnosing, preventing and/or treating tuberculosis infection. The present sequence is used in the exemplification of the invention.
                                                                                                                                                   81 IleThrAlaValAspGlyAlaProIleAsnSerAlaThrAlaMetAlaAspAlaLeuAsn 100
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New isolated nucleic acid encoding a fusion polypeptide with the MTB32A and MTB39 antigens, with or without the MTB85A antigen, from a Mycobacterium species, useful for diagnosing, preventing and/or treating tuberculosis infection.

The invention relates to a novel nucleic acid encoding a fusion polypeptide, comprising a MTB12A and MTB39 antigen, or MTB12A, MTB39 and MTB85A antigen from a Mycobacterium species of the tuberculosis complex. A polypeptide of the invention has tuberculostatic activity. A polymerclotide of the invention may have a use in gene therapy, and as a vectine. The methods and compositions of the present invention are useful for diagnosing, preventing and/or treating tuberculosis infection. The present sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     81 IleThrAlaValAspGlyAlaProIleAsnSerAlaThrAlaMetAlaAspAlaLeuAsn 100

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               MTB85A;
New isolated nucleic acid encoding a fusion polypeptide with the MTB32A and MTB39 antigens, with or without the MTB85A antigen, from a Mycobacterium species, useful for diagnosing, preventing and/or treating tuberculosis infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    101 GlyHisHisProGlyAspVallleSerValThrTrpGlnThrLysSerGlyGlyThrhrg

A polypeptide of the invention has tuberculostatic activity. A polypeptide of the invention may have a use in gene therapy, and as a vaccine. The methods and compositions of the present invention are useful for diagnosing, preventing and/or treating tuberculosis infection. The present sequence is used in the exemplification of the invention.

The invention relates to a novel nucleic acid encoding a fusion polypeptide, comprising a MTB12A and MTB39 antigen, or MTB12A, MTB32A and MTB39 antigen, or MTB12A, MTB32A and MTB39 antigen from a Mycobacterium species of the tuberculosis complex. A polypeptide of the invention has tuberculostatic activity. A polypeptide of the invention may have a use in gene therapy, and as a vectine. The methods and compositions of the present invention are useful for diagnosing, preventing and/or treating tuberculosis infection. The present sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New isolated nucleic acid encoding a fusion polypeptide with the MTB32A and MTB39 antigens, with or without the MTB85A antigen, from a Mycobacterium species, useful for diagnosing, preventing and/or treating tuberculosis infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      20

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                            US-09-684-215B-4
